Porphyrins and Their Origins

- **What is a porphyrin?**
 - A family of vibrantly colored compounds
 - Planar structure containing alternating single and double bonds
 - Parent structure: four small rings composed of four carbons and one nitrogen, joined together by carbon linking bridges
- **Nomenclature:** comes from the Greek word *porphyra* = “purple”
 - Indicates the defining characteristic of the purple nature of free base porphyrins

***Put in images of free base purple porphyrins in the lab

Porphyryns and Their Origins

- **Historical Context:**
 - Phoenicians collected mollusks containing a purple pigment known as **Tyrian Purple**
 - Pigment used to dye robes of emperors in a highly secretive process
 - Developed an association between royalty and the color purple

Porphyryns and Their Origins

- **Historical Context:**
 - Ancient Greeks intensified the royal connection
 - Each palace contained a special room constructed entirely from a deep purple, expensive Egyptian stone known as **porphyry**
 - Sole use of the room: the birth of the heir to the throne
 - Signified the importance of the newborn

Modern Day Context

- Hans Fischer
 - The Father of modern porphyrin chemistry
 - 1929: Synthesized **heme**, the major component of blood, which binds and transports oxygen

Structure

- Flat, planar structure formed through a condensation reaction
 - Condensation reaction: joining two molecules through the loss of water

- Reaction with transition metals forms a **metal complex**

Periodic Table of the Elements

Atomic Number	Symbol	Name	Electron Configuration
1	H	Hydrogen	1s ¹
2	He	Helium	1s ²
3	Li	Lithium	[He] 2s ¹
4	Be	Beryllium	[He] 2s ²
5	B	Boron	[He] 2s ² 2p ¹
6	C	Carbon	[He] 2s ² 2p ²
7	N	Nitrogen	[He] 2s ² 2p ³
8	O	Oxygen	[He] 2s ² 2p ⁴
9	F	Fluorine	[He] 2s ² 2p ⁵
10	Ne	Neon	[He] 2s ² 2p ⁶
11	Na	Sodium	[Ne] 3s ¹
12	Mg	Magnesium	[Ne] 3s ²
13	Al	Aluminum	[Ne] 3s ² 3p ¹
14	Si	Silicon	[Ne] 3s ² 3p ²
15	P	Phosphorus	[Ne] 3s ² 3p ³
16	S	Sulfur	[Ne] 3s ² 3p ⁴
17	Cl	Chlorine	[Ne] 3s ² 3p ⁵
18	Ar	Argon	[Ne] 3s ² 3p ⁶
19	K	Potassium	[Ar] 4s ¹
20	Ca	Calcium	[Ar] 4s ²
21	Sc	Scandium	[Ar] 3d ¹ 4s ²
22	Ti	Titanium	[Ar] 3d ² 4s ²
23	V	Vanadium	[Ar] 3d ³ 4s ²
24	Cr	Chromium	[Ar] 3d ⁵ 4s ¹
25	Mn	Manganese	[Ar] 3d ⁵ 4s ²
26	Fe	Iron	[Ar] 3d ⁶ 4s ²
27	Co	Cobalt	[Ar] 3d ⁷ 4s ²
28	Ni	Nickel	[Ar] 3d ⁸ 4s ²
29	Cu	Copper	[Ar] 3d ¹⁰ 4s ¹
30	Zn	Zinc	[Ar] 3d ¹⁰ 4s ²
31	Ga	Gallium	[Ar] 3d ¹⁰ 4s ² 4p ¹
32	Ge	Germanium	[Ar] 3d ¹⁰ 4s ² 4p ²
33	As	Arsenic	[Ar] 3d ¹⁰ 4s ² 4p ³
34	Se	Selenium	[Ar] 3d ¹⁰ 4s ² 4p ⁴
35	Br	Bromine	[Ar] 3d ¹⁰ 4s ² 4p ⁵
36	Kr	Krypton	[Ar] 3d ¹⁰ 4s ² 4p ⁶
37	Rb	Rubidium	[Kr] 5s ¹
38	Sr	Strontium	[Kr] 5s ²
39	Y	Yttrium	[Kr] 4d ¹ 5s ²
40	Zr	Zirconium	[Kr] 4d ² 5s ²
41	Nb	Niobium	[Kr] 4d ⁴ 5s ¹
42	Mo	Molybdenum	[Kr] 4d ⁵ 5s ¹
43	Tc	Technetium	[Kr] 4d ⁵ 5s ²
44	Ru	Ruthenium	[Kr] 4d ⁷ 5s ¹
45	Rh	Rhodium	[Kr] 4d ⁸ 5s ¹
46	Pd	Palladium	[Kr] 4d ¹⁰
47	Ag	Silver	[Kr] 4d ¹⁰ 5s ¹
48	Cd	Cadmium	[Kr] 4d ¹⁰ 5s ²
49	In	Indium	[Kr] 4d ¹⁰ 5s ² 5p ¹
50	Sn	Tin	[Kr] 4d ¹⁰ 5s ² 5p ²
51	Sb	Antimony	[Kr] 4d ¹⁰ 5s ² 5p ³
52	Te	Tellurium	[Kr] 4d ¹⁰ 5s ² 5p ⁴
53	I	Iodine	[Kr] 4d ¹⁰ 5s ² 5p ⁵
54	Xe	Xenon	[Kr] 4d ¹⁰ 5s ² 5p ⁶
55	Cs	Cesium	[Xe] 6s ¹
56	Ba	Barium	[Xe] 6s ²
57-71	Lanthanides		
72	Hf	Hafnium	[Xe] 4f ¹⁴ 5d ² 6s ²
73	Ta	Tantalum	[Xe] 4f ¹⁴ 5d ³ 6s ²
74	W	Tungsten	[Xe] 4f ¹⁴ 5d ⁴ 6s ²
75	Re	Rhenium	[Xe] 4f ¹⁴ 5d ⁵ 6s ²
76	Os	Osmium	[Xe] 4f ¹⁴ 5d ⁶ 6s ²
77	Ir	Iridium	[Xe] 4f ¹⁴ 5d ⁷ 6s ²
78	Pt	Platinum	[Xe] 4f ¹⁴ 5d ⁹ 6s ¹
79	Au	Gold	[Xe] 4f ¹⁴ 5d ¹⁰ 6s ¹
80	Hg	Mercury	[Xe] 4f ¹⁴ 5d ¹⁰ 6s ²
81	Tl	Thallium	[Xe] 4f ¹⁴ 5d ¹⁰ 6s ² 6p ¹
82	Pb	Lead	[Xe] 4f ¹⁴ 5d ¹⁰ 6s ² 6p ²
83	Bi	Bismuth	[Xe] 4f ¹⁴ 5d ¹⁰ 6s ² 6p ³
84	Po	Polonium	[Xe] 4f ¹⁴ 5d ¹⁰ 6s ² 6p ⁴
85	At	Astatine	[Xe] 4f ¹⁴ 5d ¹⁰ 6s ² 6p ⁵
86	Rn	Radon	[Xe] 4f ¹⁴ 5d ¹⁰ 6s ² 6p ⁶
87	Fr	Francium	[Rn] 7s ¹
88	Ra	Radium	[Rn] 7s ²
89-103	Actinides		
104	Rf	Rutherfordium	[Rn] 5f ¹⁴ 6d ² 7s ²
105	Db	Dubnium	[Rn] 5f ¹⁴ 6d ³ 7s ²
106	Sg	Seaborgium	[Rn] 5f ¹⁴ 6d ⁴ 7s ²
107	Bh	Berkelium	[Rn] 5f ¹⁴ 6d ⁵ 7s ²
108	Hs	Hassium	[Rn] 5f ¹⁴ 6d ⁶ 7s ²
109	Mt	Moscovium	[Rn] 5f ¹⁴ 6d ⁷ 7s ²
110	Ds	Darmstadtium	[Rn] 5f ¹⁴ 6d ⁸ 7s ²
111	Cn	Copernicium	[Rn] 5f ¹⁴ 6d ¹⁰ 7s ¹
112	Uut	Ununtrium	[Rn] 5f ¹⁴ 6d ¹⁰ 7s ² 7p ¹
113	Uuq	Ununquadium	[Rn] 5f ¹⁴ 6d ¹⁰ 7s ² 7p ²
114	Fl	Flerovium	[Rn] 5f ¹⁴ 6d ¹⁰ 7s ² 7p ³
115	Uup	Ununpentium	[Rn] 5f ¹⁴ 6d ¹⁰ 7s ² 7p ⁴
116	Lv	Livermorium	[Rn] 5f ¹⁴ 6d ¹⁰ 7s ² 7p ⁵
117	Uus	Ununseptium	[Rn] 5f ¹⁴ 6d ¹⁰ 7s ² 7p ⁶
118	Uuo	Ununoctium	[Rn] 5f ¹⁴ 6d ¹⁰ 7s ² 7p ⁶

Chemical Characteristics

- Free-base porphyrin = deep purple solid; red in solution
- Addition of ligands to red reaction sites, protonation (addition of H) to single nitrogen, loss of double bonds, or complex of metal center will cause shift in color spectrum
- UV active
- Acid labile: reactive in acidic conditions
- Aromatic compounds
- Flexible: can distort and lose planarity to accommodate large metal centers

All About Aromaticity

- **What does it mean to be aromatic?**
 - A flat, ring-shaped, highly stable (unreactive) molecule containing alternating sigma and pi bonds
 - Alternating pattern is known as **conjugation**
 - Alternating bonds cause electrons in pi bonds to become delocalized → form a circulating cloud above and below the ring
 - More conjugation = higher stability
- **Huckel's Rule:** All aromatic compounds have $4n+2$ pi electrons in their electron cloud
 - Free base porphyrin has 22; **Let's count them!**
 - 11 pi bonds, each containing 2 pi electrons: $2 \times 11 = 22$
 - $4n + 2 = 22 \rightarrow n = 5$

UV-Vis Spectroscopy

- UV-Visible Spectroscopy: an analytical technique used to characterize molecules
 - Compounds will absorb light at a specific frequency and reflect light at another, resulting in the colors we view
 - Involves shining light through a sample of a compound containing pi electrons
 - Electrons absorb energy and are excited to a higher energy level
 - Difference in energy level, ΔG , is inversely proportional to the wavelength of light it absorbs and thus, the color it reflects

Visible Light Spectrum

Let's Talk About Color

- Various structural changes shift the solid state color of porphyrins from deep purple to all shades of the rainbow
 - Addition of substituents to different reactive sites on the porphyrin
 - Addition of different metal centers
 - Increase or decrease in conjugation, or alteration in conjugation pattern
- Addition of Substituents:
 - Free base = wine red in solution
 - B substituted = magenta in solution
 - Meso substituted = emerald green in solution
 - **Why?** Substitution at different positions leads to distortions and shape changes, creating tension which alters the energy gap between the ground and excited states
 - **Think of a spring! Tightly coiled = more likely to spring back = has more energy**

Metal Centers

- Who likes prosciutto?
 - Parma ham exhibits a red color due to a zinc center

- Blue blood vs. Red Blood
 - Ever wondered why our blood is red?
 - The iron center in the porphyrin complex called heme
 - What about lobsters?
 - Lobsters have blue blood because they have a copper atom as the center of their heme complex instead

Wakamatsu, J.; Nishimura, T. *Meat Science*. **2004**, 67, 95-100.

Bird Feathers

- Found in the pigments of bird feathers such as the Turaco and Blood Pheasant
- Turacoverdin = Copper centered porphyrin
 - Blue of the copper mixes with another family of yellow compounds called carotenoids to make vivid green feathers
- Turacin
 - Also copper centered complex, but this time bright red

Color and Conjugation

- Increased conjugation leads to increased (longer) wavelengths of light absorption and reflection
 - Remember how aromatic compounds are more stable?
 - More stable = less energy between ground and excited state
 - Less energy = longer wavelength
- Increasing conjugation increases stability, and aromaticity increases stability even more

Colorless (Absorbs in the UV range)

Benzene, a simple aromatic compound

Colored (Absorbs in the Visible range)

Porphyrins, with much more conjugation

Comparison Study

Biosynthesis

- Synthesized in a series of **enzyme catalyzed** steps
- Occurs in the **mitochondria** and **cytosol** of the cell
- Join together four rings in a head to tail fashion to form a linear molecule
 - **Uroporphyrinogen III** = the parent molecule for all biosynthesized porphyrins
 - Why III? There are four different ways to arrange atoms A and B. These are called **isomers**
 - The third arrangement is the most **thermodynamically favorable**
 - During the cyclization step, enzymes instinctively flip the last ring subunit...notice the pattern of A and B changes!
- Following steps diverge to form specific biological molecule
 - Addition of side chains and double bonds, metal insertion

Vampires vs. Werewolves

Where did the myths come from?

- Porphyrins = a class of diseases occurring due to malfunctions during biosynthesis
- Symptoms:
 - Extreme sensitivity to light, implications in psychiatric disorders, other genetic abnormalities
- This led to the creation of myths about vampires and werewolves
 - Light sensitive skin = won't go outside during the day, but will at night when it's dark
 - Psychiatric disorders = can lead to sleep abnormalities, such as being nocturnal
 - Porphyrins are red = when deposited in the teeth, would stain teeth red
 - Causes gums to tighten and shrink = teeth appear elongated
 - Minimized levels of correctly synthesized heme (major component of blood) = would drink blood to increase heme levels
 - Garlic breaks down red blood cells = Inflicted would avoid eating garlic

Heme

- Iron-centered porphyrin complex
- Plays a variety of roles during cellular respiration
- Different substituents attached to central porphyrin ring determine its function
 - Oxygen storage
 - Oxygen transport
 - Electron transport
- Iron cycles between 2+ and 3+ oxidation states
- Cyanide poisoning = When cyanide binds to iron instead of oxygen, causing it to remain stuck in the 3+ state
- Anti-aging = Defends against oxygen radicals

Hemoglobin

- Binds oxygen in the blood and transports it around the cell
 - Iron-centered heme complex is deeply buried inside protein chains
 - Hydrophobic = water fearing
 - Proteins form hydrophobic compartment around heme complex ,repelling polar molecules
 - Extremely protected from interactions with any small molecules in exterior environment
 - Iron is too big to fit inside porphyrin cavity, until it binds to oxygen
 - Iron shrinks to fit within porphyrin ring
- 

Cytochrome C

- Binds oxygen as an electron supplier to power energy synthesis
- Heme unit close to the surface of the protein unit, unlike hemoglobin
- Quick biology lesson!
 - During cellular respiration, a molecule of O_2 splits, transferring electrons
 - Electrons are used in the synthesis of ATP (energy!)
- Iron center in cytochrome C picks up electrons and transfers them to the following enzyme
- Picking up electrons = reduction to Fe^{2+}
- Transferring them = oxidation back to Fe^{3+}

Chlorophyll

- Light absorbing pigment contained in photosynthetic organisms
- Magnesium centered porphyrin analogue
 - Chlorin = contains fewer double bonds than original parent porphyrin
- Contains a magnesium center
 - Metal center binds to water (source of electrons) and oxidizes it and produce oxygen
- Molecule absorbs strongly in the visible light range due to conjugation
 - Photons of light are used as reactants in photosynthesis

Vitamin B₁₂

- Important in the metabolism of amino acids
- More reduced structure = contains less double bonds within ring
 - Allows for increased flexibility
 - Tends to adopt buckled configurations rather than standard planar formation
 - Lack of double bonds leads to conjugation on only a portion of the ring
- Contains a cobalt atom in its center
- Only known stable biomolecule containing a metal-carbon bond
- Microorganisms are the only producers of Vitamin B₁₂
- Higher organisms obtain vitamin through metabolism

Dinosaur Porphyrins

- Petroporphyrins (geoporphyrins) = Extinct class of exotic porphyrins no longer found in living organisms
- Molecular fossils of heme, chlorophyll
 - Formed through their degradation
- Found in coal, petroleum and shale deposits
- Used to determine the relative age of rock and fossils
- First petroporphyrin discovered contained a vanadium center and was known as VODPEP
- Nickel or vanadium centered complexes
- Extreme environment leads to all types of interesting chemistry
- Abelsonite = the only known geoporphyrin with a crystalline structure, containing a nickel center

Abelsonite

Phthalocyanines

- Chemically synthesized porphyrin derivative
- Contains an iron or copper metal center
- Highly stable, even in acidic or high temperature conditions
- Deep blue crystalline solid
 - More electronegative nitrogens in porphyrin ring attract electrons, increasing pi density and stabilizing (lowering) energy levels
 - Benzene rings increase conjugation, shifting light reflection from purple visible light to blue visible light
- Intense color makes it highly useful in dyes and pigments
- Chemists attach chlorine to rings to shift the color towards more green hues

Other Synthetic Porphyrins

- Synthetic porphyrins open up a realm of colorful possibilities
- Scientists synthesized a series of porphyrins named after gemstones
 - Even one named after the Wizard of Oz, called **ozaphyrin**
- Sapphyrin = First “jewel” molecule; accidentally synthesized during attempts to synthesize Vitamin B₁₂
- Modification to the number of double bonds, the number of bridging carbons, and the bridging pattern between rings drastically alters the color spectrum
- Changing the nitrogens within the porphyrin ring to other electronegative atoms (sulfur, oxygen) also lead to color changes

A Renewable Energy Source

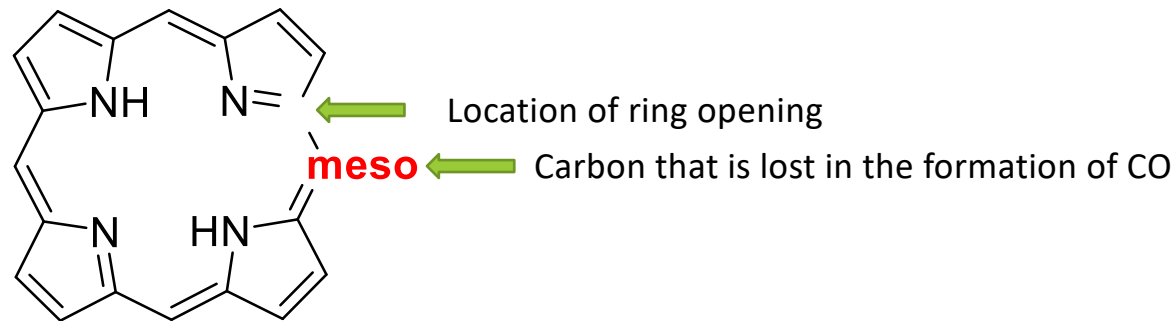

- Hydrogen is a solution to the search for renewable energy...but how to produce it?
- Photochemical water splitting = mimics photosynthesis by using sunlight to split water molecules and generate hydrogen gas
- Makes use of rechargeable photoelectrochemical cells
 - Semiconductor absorbs light energy and generates electrons, which pass into solution to split water molecules and produce H₂
- Zinc centered porphyrins are highly successful semiconductors in photoelectrochemical cells
 - Porphyrins absorb large amounts of visible light, conduct a small current when exposed to sunlight, and have favorable redox potentials
 - Zinc's electrons remain excited for long periods of time, extending the lifetime of the cell
- Lord Porter, at the Royal Institute of Great Britain, developed one of the most successful photochemical water splitting systems known

Treating Cancer

- Photodynamic Therapy (PDT) = using light sensitive compounds to trigger cell death
- Inject patients with a mixture of porphyrins called HpD
 - Some of these are photoactive
- Porphyrins attracted to and accumulate in the tumor
- When exposed to light rays, produce oxygen to trigger cell death
- Problems:
 - Not all porphyrins in HpD are photoactive
 - HpD also travels to healthy cells
 - HpD absorbs in the wrong region of the electromagnetic spectrum
- Scientists working to develop porphyrins which will absorb light that is able to pass through human tissues

Biodegradation

- Heme and chlorophyll are broken down into linear molecules called **bile pigments**
- Chemical term = bilin
 - We saw this as an intermediate during the biosynthesis!
- Formed through a ring opening at the alpha carbon and a loss of the adjacent meso carbon to produce carbon monoxide as a byproduct
- **Biliverdin** and **bilirubin** = important bile pigments at various stages during breakdown

Biliverdin and Bilirubin

- Biliverdin = a green pigment
 - Responsible for the green color in bruises
 - Found in green skin pigment of animals and reptiles
 - Gives eggshells a green tint
 - Highly useful in helping organisms camouflage within the environment
 - Water soluble and easily excreted = gives bird, reptile and amphibian droppings their green color
 - Further reduced to form bilirubin
- Bilirubin = a yellow pigment
 - Gives bruises their yellow color
 - Further breakdown of biliverdin to produce bilirubin is the reason why bruises fade from green to yellow

Jaundice

- Bilirubin is not water soluble
- Processing occurs in the liver, where structural changes are made to allow the body to excrete the compound
- If processing does not occur, compound is insoluble
→ **build up** of bilirubin
- Bilirubin is **lipid-soluble** → it is capable of passing back through the cell membrane
- Build-up of bilirubin leads to **Jaundice**
 - Symptoms of jaundice include yellowing skin, caused by the yellow color of excess bilirubin
